The majority of volcanoes in the world form along the boundaries of Earth's tectonic plates—massive expanses of our planet's lithosphere that continually shift, bumping into one another. When tectonic plates collide, one often plunges deep below the other in what's known as a subduction zone.

Volcanoes, explained - National Geographic

Other volcanoes are dormant; they are quiet for now but could become active. There are even

extinct volcanoes, which are never expected to erupt again. Volcanoes aren't unique to Earth. The largest volcano in our solar system is Olympus Mons on Mars. It is three times taller than Mt. Everest, Earth's highest elevation.

Volcanoes | National Geographic Society

When magma finds a way to escape from beneath the earth's surface, it creates a volcano. Volcanoes erupt in different ways. Some, like Mount St. Helens, explode. Explosive eruptions are so powerful, they can shoot particles 20 miles up (32 kilometers), hurl 8-ton boulders more than a half mile (0.8 kilometers) away,...
